Based on what you've said, my suspicion then leads me to think that you could be hitting some sort of file or OS limits. The NS_ERROR_FILE_ACCESS_DENIED is interesting though. You'd only really get that with the wrong permissions, but maybe something else is accessing it? iirc the local folder backend is all single threaded though.

Random thought, maybe try forcing the DB closed occasionally, e.g. <https://searchfox.org/comm-central/rev/2b1d1a5035c455aad12f56fdadab3bb748d7e44d/mailnews/import/src/nsImportMail.cpp#662-669> something like `parent->ForceDBClosed()` or maybe do that on the created childs.

Otherwise you're probably into a debug build of Thunderbird to figure out what's happening.
